Participate in a research study and receive intervention

Wanted: Families with a child 12-42 months old that has difficulties with a social attention and communication or suspected of or diagnosed with autism spectrum disorder (ASD).

Learning about your child:
- Through caregiver interviews and child assessments
- Collecting a video of you and your child playing together

Group Assignment:
- Families will be assigned by chance (like flipping a coin) to a Pathways parent coaching intervention or a parent education intervention group.

The Interventions
- **Pathways parent coaching**: Families will receive in-home coaching sessions with study personnel each week.
- **Parent education intervention**: Families will receive an educational video lesson or a teleconference session with study personnel each week.
- **Both interventions are 24 weeks**

Benefits: Families and children will benefit from learning more about social attention and communication delays and resources available from either a parent-coaching intervention or a parent-only education intervention. They may also benefit from receiving additional information about their child from the assessments.

Risks: All risks for this research are the same as those related to the intervention without research.
