Communities of color often face environmental racism and health inequity from disproportionate exposure to multiple co-occurring environmental pollutants, adverse climate impacts, and other social and economic stressors.

Eight UCI schools (Public Health, Social Ecology, Biological Sciences, Physical Sciences, Engineering, Business, Humanities, & Social Sciences) are recruiting new PhD students (Fall 2022) who will contribute their lived experience and skills to address environmental racism and health inequities.

Fellows will receive opportunities for:
- structured training on domain knowledge regarding environmental racism and health equity, research skills, & professionalism
- community-based participatory research project experience
- mentoring and support from university and boarder community
- collaboration across schools, local institutions, and communities
